

What is a DataStore?

A DataStore is a cloud data storage or database which is leveraged by GenAI models to retrieve, generate, and analyze data.

They can be your text files, pdfs, documents etc.

What is RAG pipeline?

Imagine you ask a smart AI assistant a question, but instead of just guessing, it looks up real information first before answering.

Here's how it works in 5 simple steps:

- 1 You ask a question → Like "How do I fix my WiFi?"
- 2 AI searches for answers → It checks help articles, past solutions, and FAQs.
- 3 AI reads the best info → It picks the most relevant details.
- 4 AI writes an answer → It combines the found info with its own knowledge.
- 5 You get a solid response → More accurate than AI making things up! ✅

Behind the scene at high level

What are Playbook/Agents?

These are AI workflows with set of instructions for AI to think, plan, reason and take action.

Example: AI Travel Assistant (Agentic Agent) ✈️

Let's say you want an AI to plan a vacation.

- ◆ A basic AI powered search engine will provide you list of your flights with filters.
- ◆ An agentic agent would:
 - 1 Search flights & hotels based on your budget.
 - 2 Compare prices & suggest the best deals.
 - 3 Book everything for you (if given permission).
 - 4 Create an itinerary with weather updates & local attractions.

5 Adjust plans if flights change or prices drop.
